

UIJUNGBOO City Installation, Korea: iTV Broadcast Transcript in English

Anchor Woman:

Good Evening! This is iTV news on Saturday, April 13th.

Anchor Man:

Software that enables five users to use one PC simultaneously and independently has been developed.

Through utilization of this software, government offices and schools can save a great deal in IT related cost.

Reporter Bae will introduce us to this software.

Reporter Bae:

This computer class holds 36 PC users. There are 36 sets of monitors, keyboards, and mice, but there are only nine host PCs. Four people can share one PC by connecting four sets of monitors, keyboards, and mice through a USB port and installing the (BeTwin) software.

Although each of the four users connects to the same host system, they can access different application programs or enjoy the same game together, simultaneously.

With an original IT budget of \$43,600 for this computer class, UIJUNGBOO city ended up spending less than half that by utilizing this (BeTwin) solution.

IT Manager of UIJUNGBOO city:

Initially, we set the budget for the computer class to \$43,000, but were able to save over \$24,000, having spent only \$19,300 to complete the set-up.

Reporter:

When considering the reduction in expenditure for each application software license and expenditure for high-speed Internet access, there will be even more savings to come.

The president of the BeTwin distributor:

In view of the fact that five users on one host PC can access programs, peripheral devices, and surf the Internet by utilizing the multi-tasking function of Windows combined with our software, the PC becomes more like a server.

Reporter:

Through the development and advancement of software, the concept of the PC has changed for the future: It is now more like a server.
